

# Division

Step 1	Examples	Step 2	Examples	Step 3
<p><b>Concrete Sharing</b></p> <p>The first step requires the children to use objects or images to share.</p> <p>Language should be extended to: _____ shared by _____</p> <p>Remainders are expressed as 1 left, 2 left etc.</p>	<p><math>6 \div 2 = 3</math></p>  <p><math>21 \div 3 = 7</math></p>  <p><math>15 \div 5 = 3</math></p> 	<p><b>Concrete Grouping</b></p> <p>The children should recognise division as grouping as well as sharing. This can be done with objects or images.</p> <p>Language should be extended to: How many groups of _____ can we get out of _____?</p> <p>Remainders are expressed as 1 left, 2 left etc</p>	<p><b>How many groups of 3 can you make with 12 strawberries?</b></p>  <p><math>12 \div 3 = 4</math></p>  <p><math>16 \div 4 = 4</math></p> 	<p><b>Grouping on a number line</b></p> <p>This step requires the children to count on using a number line in relevant groups.</p> <p>Step should be extended to not using the number line and using tables knowledge or counting strategies.</p> <p>The division number sentence should be shown with the calculations.</p> <p>Remainders are referred to as remainders. Remainders should be rounded up or down if appropriate.</p> <p><b>Example</b></p> 
<p><b>Short method for <math>\div</math> O</b></p> <p>This step requires the children to carry remainders within the calculation to make it more efficient. It should be used to divide TO, HTO, ThHTO as well as decimals.</p> <p>Children should be taught how to express remainders as fractions. Decimal places should also be added to show remainders as decimals remainders should be rounded up or down if appropriate.</p>	<p><math>847 \div 5 = 169 \text{ r}2</math></p>  <p><math>79 \div 5 = 15.8</math></p> 	<p><b>Short method for <math>\div</math> TO</b></p> <p>This step requires the children to divide by TO. It requires the same method as step 5 although the children should be encouraged to write the tables of the divisor.</p>	<p><math>859 \div 32 = 27 \text{ r}9</math></p>  	<p><b>Formal written method of long division:</b></p> <p><b>Divide:</b> how many times does the divisor fit into the number without remainder</p> <p><b>Multiply:</b> multiply the answer by the divisor to reach the multiple needed to calculate the remainder</p> <p><b>Subtract:</b> subtract the multiple from the original number to calculate the remainder</p> <p><b>Bring the next digit down:</b> this replaces the 'write the remainder just before the next number' step in short division. Repeat until all parts of the number are divided.</p>
